How can you contribute to the conquest game?

Creating questions:

Each question must be in a separate PNG file. The solution must be an integer or a decimal. The START of each filename must be the solution. Everything afterwards is ignored, so that each of

-1.5 i like cats.png
-1.5.png
-1.5s22p32q8.png

will be recognized as a question with solution -1.5. Feel free to take notes (e.g. source of the question).

Optionally, to mark difficulty, you can add the words **easy, medium, moderate, hard** in the filename:

0.724 easy June 22_12_q7a.png
1.5 medium Nov 20_11_q5.png
1.57 easy June 21_11_Q4.png
2 easy June 20_13_q9b.png

14.5 papa5 moderate force 14.5.png
16 papa69a easy kine 16.png
17.3 papa252 energy easy 17.3.png
17.4 papa27 medium force 17.4.png
18 papa230 easy energy 18.png

This will make it easier to set up the "bucket system" that determines the order in which questions are assigned.

Please add some redundancy. Either prepare a separate document with the filenames+solutions or just repeat the solution multiple times in the filename. *During the game, we can easily invalidate any question there is an issue with, and clearly noting the question's source will make it easy to review what was wrong with it afterwards (usual suspects: bad cropping, poor wording, wrong solution.).*

Avoid picking questions whose solution is too easy to guess.

Evaluation and accuracy rules: *(The accuracy rules can be changed if you do not agree with them)*

Let T be the solution the teacher gave in the filename, let S be the guess of the student.

If T is an integer, only S=T is accepted (so integers must be exact).

E.g.: for T = 1325 only S=1325 is accepted. S=1330 and S=1324.99 will both be rejected.

If T is a decimal with 3 or fewer sig figs, then any S with (S rounded to 3 sig figs) = T is accepted.

E.g.: for T=1.75, all of S=1.75, S=1.7499, S=1.753 will be accepted.

For T=1.5, S=1.49 will be rejected, S=1.50001 will be accepted.

If T is a decimal with MORE than 3 sig figs, only S = T is accepted.

E.g.: for T=1.3725, S=1.37 is rejected, S=1.3724999 is rejected. This allows us to ask "exact value" problems where the answer is a terminating decimal.

(There is some floating point weirdness about how numbers are processed. For example T=13.0 is falsely recognized as the integer T=13 unfairly leading to the rejection of S=12.9999. Also, T=1.28 would not accept S=1.275 as (1.275 rounded to 3 sig figs) = 1.27 instead of 1.28 (because float 1.275 is actually smaller than 1.275.) I could implement fractions like I did with the function transformation game, but I am reluctant to do so – it would clutter the UI and complicate the code for little benefit. If the answer is the simplified fraction a/b, we can always just rewrite the question to ask for the value of integer a+b or 1000a+b or something along those lines.)

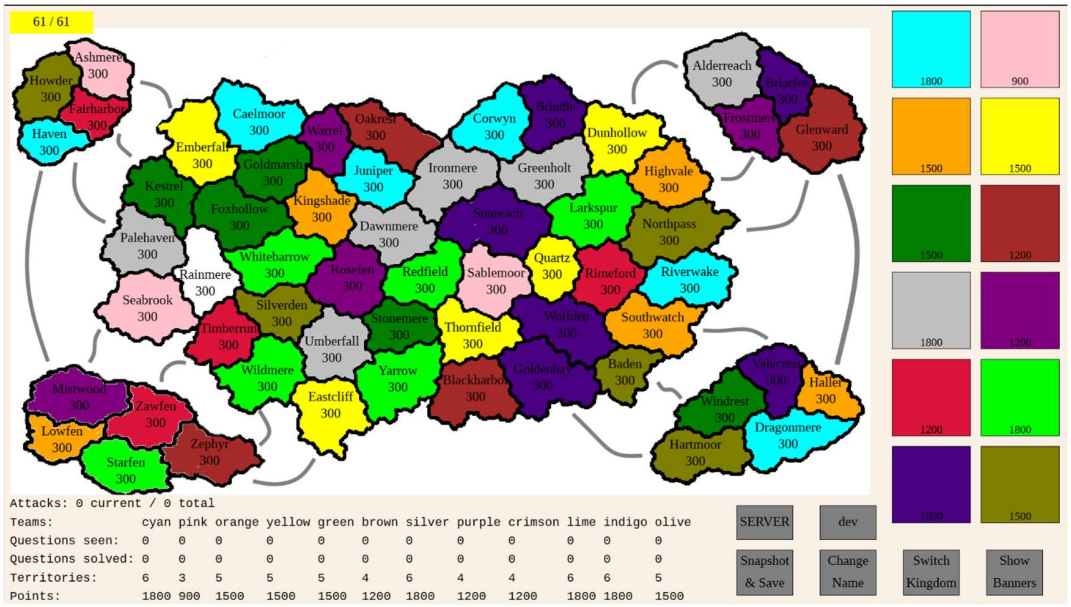
Creating maps:

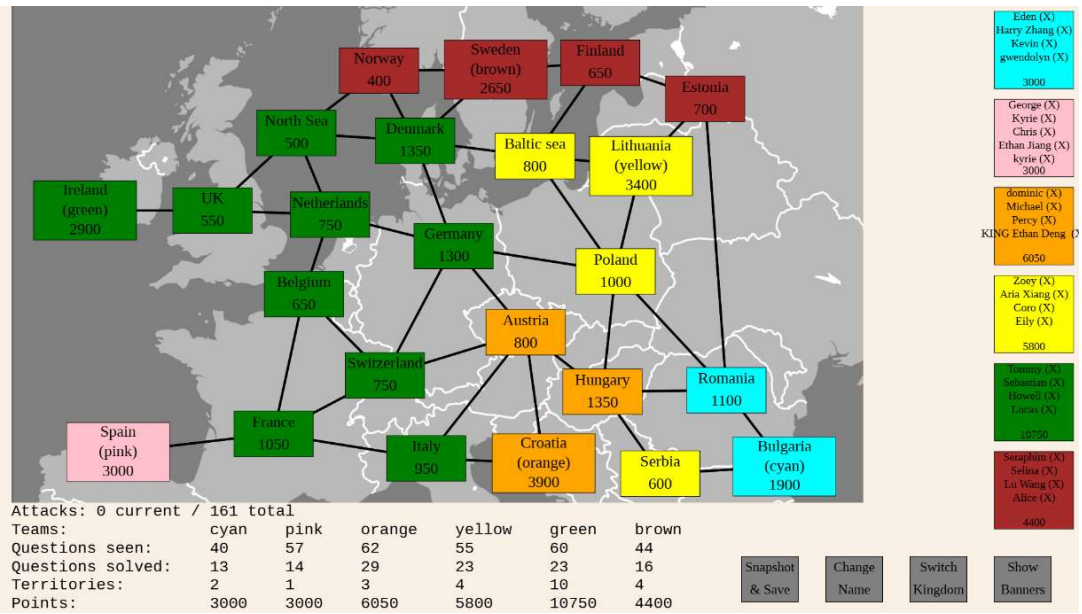
- For colored territories: a 1560x840 map picture in PNG format with **only white pixels** where the territories will be (the game will fill within the borders with the occupying team's color).
  You can have any graphics outside the borders.
- Optionally: you can add a second picture you wish to overlay after the team color was drawn (for example a stylishly drawn label, icons, trees, etc.).

- For colored buttons: any 1560x840 picture in PNG format will do. We can overlay colored buttons over the map, so this is much easier to make – but looks a lot less impressive.

I will make a map editor in April that lets you place, name, and connect the territories on your picture.

Example of a game with colored territories (preferred):





Example of a game with colored buttons:
